Magnolia cms tutorial.

So, this is your exercise: modify the code to display the image when a user clicks on a car's row, i.e. non-folder content. By default JDK is installed at C:\Program Files\Java\jdk-. Once the installation finished, you should see the following page: Now, click on the START UP MAGNOLIA button, you will be redirected to the Magnolia login screen: Now, provide username as superuser and password as superuser, then click on the LOGIN button, you should see the Magnolia dashboard in the following page: About Hitesh Jethva Over 8 years of experience as a Linux system administrator. The parameter is a comma-separated list, specifying the content type fields to fetch. The table is easy to use: you can navigate through the tree by clicking on a folder. On Debian-based distributions, JREs or JDKs are usually installed in /usr/lib/jvm/. On Windows you need a Java SE Development Kit (JDK). The parameter is the endpoint's name as specified in the restEndpoints/delivery folder. create-content-type create a content type. When you are in a subfolder, you can click on the parent folder. The installation directory varies from one Linux system to another. Requirements A server running Ubuntu 18.04. In this tutorial, we will learn how to install Magnolia in Ubuntu 18.04. Go back to Check JAVA_HOME environment variable above and test that the variable is found and has the correct value. A non-root user with sudo privileges. As I commented in the previous post, HTML templates are good for static content but not ideal for adding dynamic content because they are not versatile enough. If you don't have Java, install it. The Magnolia CLI tool runs on Node.js. Because of Web Component's templating system, I had to add too much presentation code, not helping to separate logic from presentation. Username and password is superuser The following files and folders are created: dev/ |— apache-tomcat/ |— bin/ |— conf/ |— lib/ |— logs/ |— temp/ |— webapps/ |— light-modules/ |— downloads/ Go to the parent directory of the apache-tomcat directory and execute the Magnolia CLI start command: When starting for the first time, Magnolia runs a web update and automatically installs all its modules. Web Components have the capability of observing changes in attributes using the function . If you do not have Node.js installed, go to Node.js and download and install the latest LTS version. Create JAVA_HOME here if you want it to apply to all users. Separate the path from existing paths with a semicolon (;). When you open the page, you should see this: You can click on a yellow row to open a folder and see the hierarchical content inside of it. JRE is for users who run Java programs on their computer. Magnolia CLI is an npm package providing a command line interface (CLI) tool to set up and facilitate light development with Magnolia. build scan a node_modules folder for npm packages with the keyword "magnolia-light-module" (in package.json) and extract them to a directory of choice. start start up a Magnolia CMS instance. Setting the PATH allows you to issue the Magnolia start and stop commands from anywhere without navigating to the installation directory first. It is useful for testing. You can download it with the following command: cd /opt/wget 20CE%205.6.5/magnolia-community-demo-bundle-5.6.5-tomcat-bundle.zip Once the download is completed, extract the downloaded file with the following command: unzip magnolia-community-demo-bundle-5.6.5-tomcat-bundle.zip Next, change the directory to the Magnolia and start Magnolia server with the following command: cd magnolia-5.6.5 sudo /apache-tomcat-8.5.5/bin/magnolia_control.sh start -ignore-open-files-limit Magnolia server is now running and listening on port 8080. On Linux or Mac OS X to run this command as root use: sudo npm install @magnolia/cli -g If the installation is successful, you see the following or a similar output in the shell: /usr/bin/mgnl -> /usr/lib/node_modules/@magnolia/cli/bin/mgnl.js -> spawn-sync@1.0.15 postinstall /usr/lib/node_modules/@magnolia/cli/node_modules/spawn-sync > node postinstall + @magnolia/cli@2.2.0 added 209 packages in 11.40s Once you have installed Magnolia CLI, test the installation by running the following command in the shell: Usage: mgnl [options] A tool to setup and facilitate light development with Magnolia CMS Options: -v, --version output the version number -h, --help output usage information Commands: jumpstart download and setup a Magnolia CMS instance for development. While I didn't explain all the details, I did explain the basics to help you understand what the web component does. In my previous blog post, "Web Components Part 1: Exploring Reusable Web Components" I explored Web Components as a way of overcoming the challenges of new front-end frameworks and technologies emerging constantly. Open the Security app, go to the "Roles" tab, and edit the "anonymous" role. In this post, I will show you how to build a web component called "hierarchical-browser" to navigate a hierarchical data structure using JavaScript and several Magnolia features, including our low-code development approach, content types, and our Delivery API. I will be very happy to merge them. Now that you've taken a look at my code and possibly seen the web component in action, you might want to do some coding yourself. Once you've cloned the code into your Magnolia instance, open the app and enter some initial data: To allow front ends to query this data via API, I added an endpoint definition in cars/restEndpoints/delivery/cars.yaml. The constructor sets the initial state of the component, and the state evolves with the REST calls triggered by the user's interaction. customize-local-config extract "mgnl-cli-prototypes" folder and "mgnl-cli.json" file to customize CLI configuration. You can specify any fields defined in contentTypes/cars.yaml. The functions at the beginning of hierarchical-browser.js handle the HTTP REST calls to fetch the data from the endpoint: gets a client to make calls to the server. The source code is available on GitHub. Let's take a look at the component's usage in templates/pages/main.ftl: The is the initial URL used by the REST client to make calls. create-light-module create a light module. These variables take precedence over system variables. Then, the asynchronous function processes the resulting map to get items from a specific path. The image is defined in the content type's configuration file, cars.yaml: However, the image is not yet part of the web component. Easy to use, fully-featured and highly scalable. Set the value of JAVA_HOME to the path of your JDK installation directory, for example C:\Program Files\Java\jdk-10.0.xx. Magnolia CMS has a modular architecture that allows us to install and uninstall functionality according to a project's requirements. In that case, I would like to offer you an exercise to increase your knowledge of Web Components and Magnolia. Support for Themes & Sites. To check the version of your node installation, run the following command in a shell: Run the following command in a shell to install Magnolia CLI: npm install @magnolia/cli -g Depending on your permissions and the location where you have installed Node.js, you may have to execute the command above with root permissions. You can check the response of the Delivery API with: Content in the cars workspace A public endpoint to fetch data Anonymous access to the content in the cars workspace To see the page using the web component in Magnolia, open the Pages app and add a new page using the template. The JSON response is then converted to a list of maps. Once the setup operation is complete, you should see a message similar to this one: info Magnolia has been successfully setup for light development! info You can now open a new terminal tab or window and start it up with the CLI command "mgnl start" info Magnolia will be ready after a few seconds at localhost:8080/magnolia/Author. The command is executed when Magnolia starts. My skills include a depth knowledge of Redhat/CentOS, Ubuntu Nginx and Apache, MySQL, Subversion, Linux, Ubuntu, web hosting, web server, Squid proxy, NFS, FTP, DNS, Samba, LDAP, OpenVPN, Haproxy, Amazon web services, WHMCS, OpenStack Cloud, Postfix Mail Server, Security etc. If JAVA_HOME is missing or it points to the wrong directory, see Set JAVA_HOME environment variable below. create-app create an app. The source code on GitHub already contains an entire Magnolia light module called "cars," including the Content app "cars-app," the content type "cars," the page template, and the web component. The Web Components standard offers reusable components for web development. If you implemented the light module and added cars in the Content app, you might remember that you could add an optional image from the Magnolia DAM in the car properties. Go to and sign in as: Username: superuser Password: superuser Magnolia is ready to use and gives you a list of suggestions to get started. Our web component listens to changes in the property and calls the function if that property changes: We don't need to override the function. create-page create a page template. tab-completion install tab autocomplete feature for Bash, zsh or PowerShell version display mgnl and node.js versions help [cmd] display help for [cmd] mgnl: 3.1.0 node: v8.10.0 os: linux Use the jumpstart command to install Magnolia. Type set and press ENTER. If any of the observed attributes change, the component triggers an action. Creating the web component's HTML code was the most time-consuming task. Automatic Menu Generation, Sitemaps, Google Sitemap. You can install it with the following command: sudo apt-get install oracle-java8-installer -y Once the Java is installed, you can check the Java version with the following: java -version You should see the following output: java version "1.8.0_131" Java(TM) SE Runtime Environment (build 1.8.0_131-b11) Java HotSpot(TM) 64-Bit Server VM (build 25.131-b11, mixed mode) Install Magnolia First, you will need to download the latest version of the Magnolia. create-block create a block. If you want to dig deeper, you might want to look at the code for the logic managing the parent folder, the HTTP client code, and dom manipulation. Without installation permissions you will notice messages such as npm ERR! in the shell. Check JAVA_HOME environment variable Open the command prompt. Optional step: Add the Magnolia bin directory to the PATH variable, for example C:\Program Files\magnolia\apache-tomcat-x.y\bin. It creates folders for the Tomcat server and for the light modules according to the CLI configuration. Alternatively you can set JAVA_HOME with a batch file. See the Certified stack page to confirm that the version installed is supported. The Java Runtime Environment (JRE) is not enough because the Tomcat application server does not recognize it. For example: cd /Users/dev/ Execute the Magnolia CLI jumpstart command: Choose the magnolia-community-demo-webapp containing Magnolia Community Edition bundled with the Travel Demo and a Tomcat server. The cars use case is a good and simple example to learn how to create a web component. (In Windows 7+, right-click Computer and select Advanced System Settings, then Environment variables.) If the JAVA_HOME environment variable does not exist in User variables or System variables, create it: User variables apply to the currently signed-in user only. Every time the user clicks on a folder, the web component makes a new call to get the content from the server, and we add an event using . The web component itself is just a table displaying the selected columns. Install Java Before starting, Magnolia needs java to be installed in your system. Type java -version in a terminal or command prompt. JDK is for developers who write Java-based applications. search search for a light module on npm. Using YAML, I created a Magnolia Content app with Magnolia Light Development, our low-code development approach. If you do this, you also need to add CATALINA_HOME to environment variables. You need to open a new command prompt since environment variables are session specific. I hope you enjoyed creating this web component and working with Magnolia! Magnolia is a free and open source Java-based CMS that delivers smartphone simplicity on an enterprise-scale. Add this line to /apache-tomcat/bin/magnolia_control.bat: set JAVA_HOME=C:\Program Files\Java\jdk->.xx The set command creates the JAVA_HOME environment variable and sets its value to the JDK directory. To allow users to see this content, we have to allow anonymous access to the cars workspace, as we are not using any authentication mechanism for this REST Client. Feel free to fork the GitHub repository and send pull requests with this exercise, other exercises, fixes, or improvements. Create JAVA_HOME here if you want it to apply only to the currently logged in user: create-virtual-uri create a virtual uri mapping. The cars endpoint makes content available from the cars workspace, where Magnolia stores all cars content hierarchically. Magnolia CMS Features Support for Multi-Language, Multi-Domain, Multi-Brand, and Multi-Channel. If you are interested in more advanced Web Components features, such as Web Components communication, testing, or shadow CSS, I recommend you check out my previous blog post "Web Components Part 1: Exploring Reusable Web Components" and its source code on GitHub. If the system reports a version number, Java is installed on your computer. To stop it, enter CTRL-C add-availability add component availability. view as pdf | print Share this page: DX Core Developing Magnolia front-end development Install Magnolia Magnolia needs at least a Java Runtime Environment (JRE) to run. Set JAVA_HOME environment variable Right-click My Computer and select Properties. In the subsequent JavaScript code, we initialize the client in the constructor, and is called by each time a user requests to see the elements in a specific path. It also shows the problems with HTML templates. create-component create a component and optionally add availability for it. This command downloads, unpacks and pre-configures a Magnolia bundle of your choice. The state is while we get data from the server, once the data has arrived, or . It uses a JCR repository to store, retrieve and search data. For example: mgnl jumpstart -p /Users//light-modules/ Change to the directory to where you want to install the Magnolia bundle. For example, use HTML templates for static content and a template library such as Mustache or Handlebars for dynamic content. If you already have a different directory that you want to use for light modules, use the -p option with the jumpstart command to specify the path to your existing light modules folder. Set the value of CATALINA_HOME to the Tomcat installation directory, for example C:\Program Files\magnolia\apache-tomcat-x.y Click OK. Now let's take a look at the code. The jumpstart command automatically creates a light modules directory for you in the current folder. You can choose another location. By allowing developers to create reusable elements, Web Components is making life much easier for us. If you are not familiar with Light Development yet, you can check out our Hello Magnolia tutorial. superuser is a system administrator account that has permissions to do everything. You must be an administrator to modify a system environment variable. install install a light module from npm to the local Magnolia instance. Download and install JDK. Access Magnolia Web Interface Now, open your web browser and type the URL you will be redirected to the Magnolia Welcome screen: Now, click on the "Run the Web update on the author instance", you will be redirected to the following page: Now, click on the START INSTALLATION button. Clickable items, i.e. folders, are yellow. Find JAVA_HOME in the command output and verify that the path points to your JDK installation directory, for example C:\Program Files\Java\jdk->.xx. I strongly recommend you use a web component framework or at least a hybrid templating solution. Then the tab "Access control lists" and add Read/Write access for the "Cars" workspace. Creating web components is an investment in the future because components can be used everywhere, with any JavaScript framework and in any HTML environment. Go to the Advanced tab. System variables apply to all users. In our example, the is .
